

Mr. Beast's \$1m Challenge

write-up by Team Omega

This writeup is divided into three sections:

- **C**hallenges: puzzles that seem to progress the primary solution
- **H**ints: puzzles that seem tangential to the primary solution
- **T**hreads: loose threads from videos

Every header is assigned an identifier according to where it is. Information relevant to solving the puzzle hunt is assigned a numeric identifier (e.g., [H1.1: Wells](#)).

Information irrelevant to solving the puzzle (red herrings) are assigned an alphabetic identifier (e.g., [H1.4a: Physical intersections](#)).

Artifacts marked by † were generated with LLM assistance.

In general, solutions to puzzles are **IN BOLD CAPS** and other quoted strings are *in italics*. Small print is in 9pt font.

To add or correct information, contact @retrocraft on Discord.

Hints

H1: Playlist

Opened: Feb 8, 2026 | Closed: Feb 9, 2026

Puzzles that solve to Hint 1, coming from the playlist. All puzzles were discovered and solved on the night of February 8th.

NOW, HERE'S HINT #1:

Some of these puzzles use codes you can find online.

With the Super Bowl ad, almost everything Jimmy passes by is a clue. Look up, down, forward, backward, and behind the scenes. Figure out how to get an answer from each weird thing.

In the bank, the same is true, but you will need specific content from the Super Bowl ad to solve anything there.

Last, but not least, if you found the video playlist's pinned comments, each puzzle ends in a word that makes part of a 9-word clue, in order.

The word lengths are 5, 9, 5, 7, 8, 4, 9, 6, and 5.

That will help define the nature of the search.

If you can get that 9-word clue, you'll take the first step on your journey.

There is a direct way through this ultra-hard puzzle hunt.

You can find it.

Then you can win a million dollars!

The solution, combining H1-9, is

**EVERY CHALLENGE LEADS TOWARDS [a]
LOCATION NAME SOMEWHERE AROUND [the]
WORLD**

which seems to indicate we should search for clues that arrive at locations.

H1.1: Wells

This is a simple word search that incorporates a [rebus](#). In this case, the water droplets mean “HOO”, as in H₂O. The unused squares, here highlighted in yellow, spell out

COUNT H  O INTO EACH WORD

i.e., “count H₂O droplets into each word”. The preposition “into” implies we should index into the solutions. For example, there is one droplet in **ACHOO**, so we index the first letter A. Iterating, we get

ANSWER IS EVERY

completing the puzzle.

H1.2: Strangers

This is a sudoku puzzle. Arbitrarily assign letters to numbers, chuck at your favourite sudoku solver, and profit. The missing letters to complete the checkerboard pattern spell

CHALLENGE

which is our answer.

H1.2a: Skip solving with journalism

An article in ARGNet ([Start Slacking Off with MrBeast's Million Dollar Puzzle Hunt](#)) contains the solution to the sudoku. No need to solve manually!

H1.3: #TeamSeas

The left-hand side contains genres and years for TV shows. We remove two letters from each solution to produce an answer to a right-hand side clue. Then, using the two indices attached to the clue, extract from the TV show's title two different letters. For example:

Action, 1982–1986 & 2008–2009 $\Rightarrow$ *Knight Rider*
=(remove K R) $\Rightarrow$ DITHERING (10, 7) $\Rightarrow$ E R

These letters, put together, and following the order on the right-hand side, give the clue

AT ER MF OR CH IE FR OL ES OR ME TA LS WI
TH SY MB OL PB

↓

A TERM FOR CHIEF ROLES OR METALS WITH
SYMBOL PB

↓

LEADS

which is our answer.

H1.4: \$1 vs \$500,000

Observe that the letters are clearly overlaps of two letters. Noticing that the font is Arial Black, we can create a table of the letters. This allows us to easily look up what the two letters are. Then, with a bit of trial and error, we can derive pairs of answers from each word.

Arial Black Letter Multiplication Grid (26x26)																										
	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z

Each cell shows the pixel-wise multiplication of two letters using the CSS multiply blend mode.

Row letter • Column letter (e.g., CxI at row 5, column 9)

Decoding table. — Generated programmatically using the CSS multiply blend mode and HTML canvas.[†]

After initially thinking that they must be place names (Oxford, Nebraska), and then maybe sports teams (Cracovia, McGuckian), we noticed after decoding **JUANDEZOYAS** and **MAESEFARFAN** that the only hits for both “Juan de Zoyas” and “Maese Farfan” were streets in Seville, Spain.

#	Colour	Street 1	Street 2	Municipality (Metropole)
1	red	GLENCAIRN	DANESBURY	North York (Toronto), ON, CA
2	blue	WASCANA	DEWDNEY	Regina, SK, CA
3	orange	OXFORD	BITTEL	Owensboro, KY, US
4	red	NEBRASKA	WESTWOOD	Toledo, OH, US
5	blue	SUMMIT	CAHOON	Roswell, NM, USA
6	purple	LEIPZIGER	OSCHATZER	Dresden, Germany
7	red	MCKEMY	APOLLO	Tempe, AZ, US
8	yellow	FILTWOWA	RUDAWSKA (RUDARSKA)	Warsaw, PL
9	pink	TUBINGEN	CRACOVIA	San Juan, Puerto Rico
10	green	GLENAVON	KOOLUNDA	Woodville South (Adelaide), SA, Australia
11	purple	COLFAX	ONEIDA	Denver, CO, US
12	pink	JUANDEZOYAS	MAESEFARFAN	Seville, ES

#	Colour	Street 1	Street 2	Municipality (Metropole)
13	orange	TWEEDSMUIR	DOVERCOURT	Nepean (Ottawa), ON, CA
14	yellow	GREENFOREST	MOCKINGBIRD	Wilmington, NC, USA
15	pink	MARINAGLEN	DELTAQUEEN	Sacramento, CA, US
16	green	MCGUCKIAN	MCKENDREE	Annapolis, MD, US
17	green	KALYPSO	ANNALUE	Auburn, AL, US
18	purple	LOWTHER	GOSCHEN	Dover, UK
19	blue	ATKINSON	PROSPECT	Rochester, NY, US
20	orange	NIMONS	BRUTON	Orlando, FL, USA
21	yellow	LONDONDERRY	OLDMCGREGOR	Woodway, TX, US

Decoded locations. — In suburban regions, the primary metropole is also noted. For example, the intersection of Tweedsmuir and Dovercourt is found in Nepean, a suburb of Ottawa.

Grouping the colours together, we find that all red cities start with N, all oranges with O, etc. revealing the letters

TOWARDS

which is our answer

I

H1.4a: Physical intersections

Plotting the locations on a map led us to believe there might be significance to the choice of cities. The distribution: mostly in the U.S. with a few in Canada, Europe, and Australia matches neatly with YouTube/Mr. Beast’s geographic appeal. That is, if he were to put “real-life” clues somewhere, these might be the places.

We dispatched some team members to the physical intersection of Glencairn and Danesbury in Toronto, Canada. There was nothing there.

Danesbury and Glencairn in North York in the dark, winter night. A worthless trip, unfortunately.

[writeup TODO]

QUARTET AFTER PEN BRAND LAST OR USER

H1.7: Dogs

I ADOPTED 100 DOGS!

Whose ears are up?
Who's got a toy bone?
Who's got spots?
Who's wearing a collar?
Who's wagging their tail?

Sadly, there’s no tricks here. Just do the work.

JUST A HUNDRED EXQUISITELY FUZZY
PUPPIES CAN BE VIEWED LIKE AN ADVERB, A
NUMBER FROM A SPIELBERG MOVIE, OR A
FILM BY COPPOLA

The solution to this riddle is **SOMEWHERE**, which is an
adverb, a number from *West Side Story*, and a film by Sofia
Coppola.

H1.8: Pyramids

I SPENT 100 HOURS
INSIDE THE PYRAMIDS!

Whose ears are up?
Who's got a toy bone?
Who's got spots?
Who's wearing a collar?
Who's wagging their tail?

A *word pyramid* is a puzzle laid out such that every word is a
letterwise subset of the word beneath it. The position of the
letters within the word is irrelevant; this is hinted by the clue
“Projectile diameter (either spelling)” which means we must
admit both *CALIBER* and *CALIBRE*.

The clues are arranged in alphabetical order of their
solutions. This gives us a word bank:

A	O
ADORN	OI
CABRIOLET	OPTION
CALIBER	ORBICULATE
CARBLITE	ORIENT
CIRCLEABOUT	OUTFORASPIN
DORA	OUTLINERS
DURATION	PINTO
E	PORTION
EAR	POSITRON
ECLAIR	RA
EON	RACE
ER	RAD
I	RATPOISON
INUNDATOR	RESOLUTION
INUTERO	REVOLUTIONS
ION	ROTUNDA
LECAR	ROUTINES
NO	STAINPROOF
NOTE	TONER
	TONI
	TRADEUNION
	TURNONADIME

We can then arrange the words into four word pyramids beginning with each of the four non-U vowels. There are 33 words but 34 spaces in four word pyramids, so the missing word will be our solution.

A	E
RA	ER
RAD	EAR
DORA	RACE
ADORN	LECAR
???????	ECLAIR
ROTUNDA	CALIBER
DURATION	CARBLITE
INUNDATOR	CABRIOLET
TRADEUNION	ORBICULATE
TURNONADIME	CIRCLEABOUT
I	O
OI	NO
ION	EON
TONI	NOTE
PINTO	TONER
OPTION	ORIENT
PORTION	INUTERO
POSITRON	ROUTINES
RATPOISON	OUTLINERS
STAINPROOF	RESOLUTION
OUTFORASPIN	REVOLUTIONS

The missing six-letter word that bridges *ADORN* $\Rightarrow$ *ROTUNDA* is **AROUND**, which is our solution.

H1.9: Circle

The interpretation here is as follows:

Because we can create the red triangle out of six faces, we cross out the sixth letter, A.

To calculate the solution, we must find all possible *spherical triangles* that we can create on this shape.

The shape is a *spherical disdyakis triacontahedron*. The solid used here is perhaps more commonly recognized as the shape of the (still rarely-used) d120 dice.

A d120 is defined by fifteen great circles. A *spherical triangle* is bounded by three great circles and has a known expression for area. Iterating over all possible triplets of great circles, we can calculate the area of each of the eight triangles produced by each triplet. Then, we can divide by the area of one face to get the number of faces covered.

We can solve this programmatically, producing the distribution for spherical triangle areas:[†]

Area (faces)	Count	Area (faces)	Count
1	120	17	120
2	120	18	180
3	120	19	120
4	120	21	120
6	200	22	60
7	120	23	120
8	120	26	60
9	120	27	120
10	240	29	120

Area (faces)	Count	Area (faces)	Count
11	120	30	560
13	120	32	120
14	120	34	60
15	40	38	60
16	120	42	20

Spherical triangle areas.

Then, crossing out every letter that appears in a position with non-zero triangles gives us

HOMOPHONE OF WHIRLED

which leads to our solution of **WORLD**.

I
